# HID Web Animation Direction
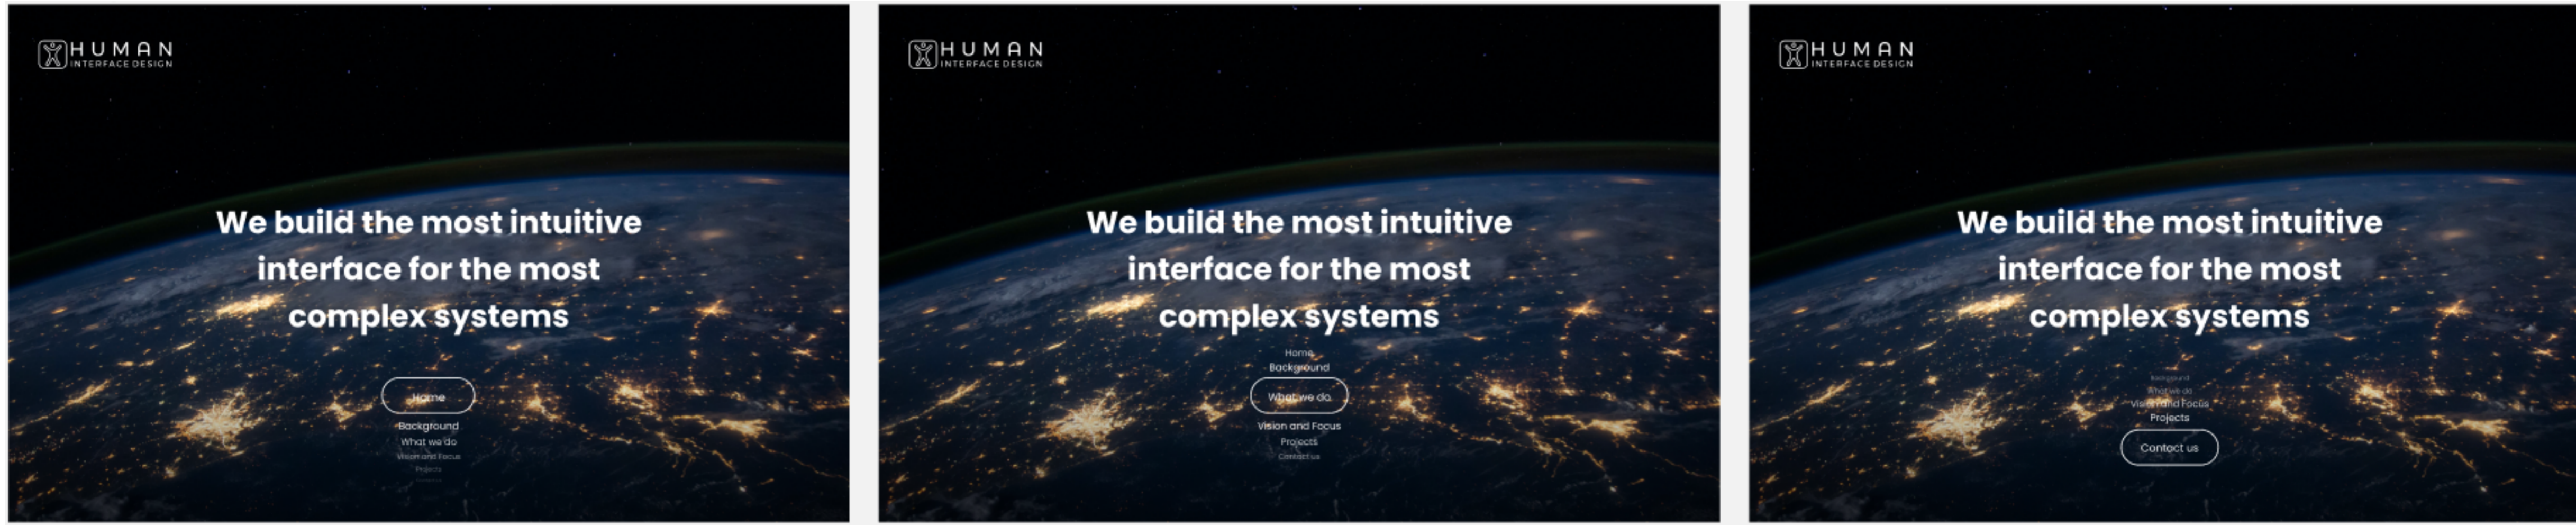

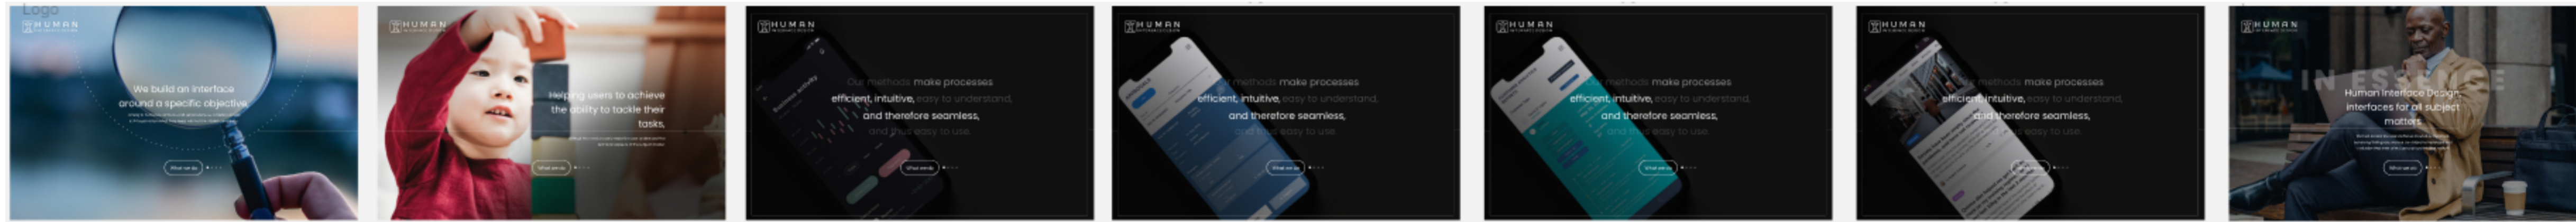

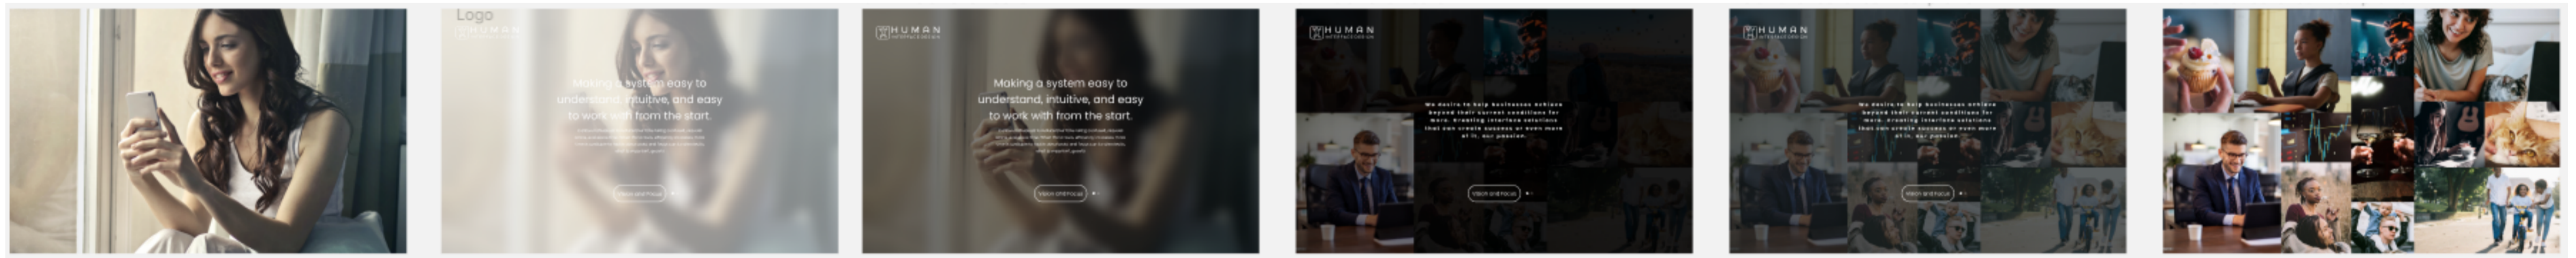

The Menu button is floating, and can be moved around.
When stationary, it will only show the bubble and the title of the page the user is in, it will also have dots to indicate the pages that the user can scroll to within the section
When clicked, the content of the pages will expand out (OSX style) to show the pages, and users can scroll up and down to put the selected page to the bubble. Clicking on it will take user to the page

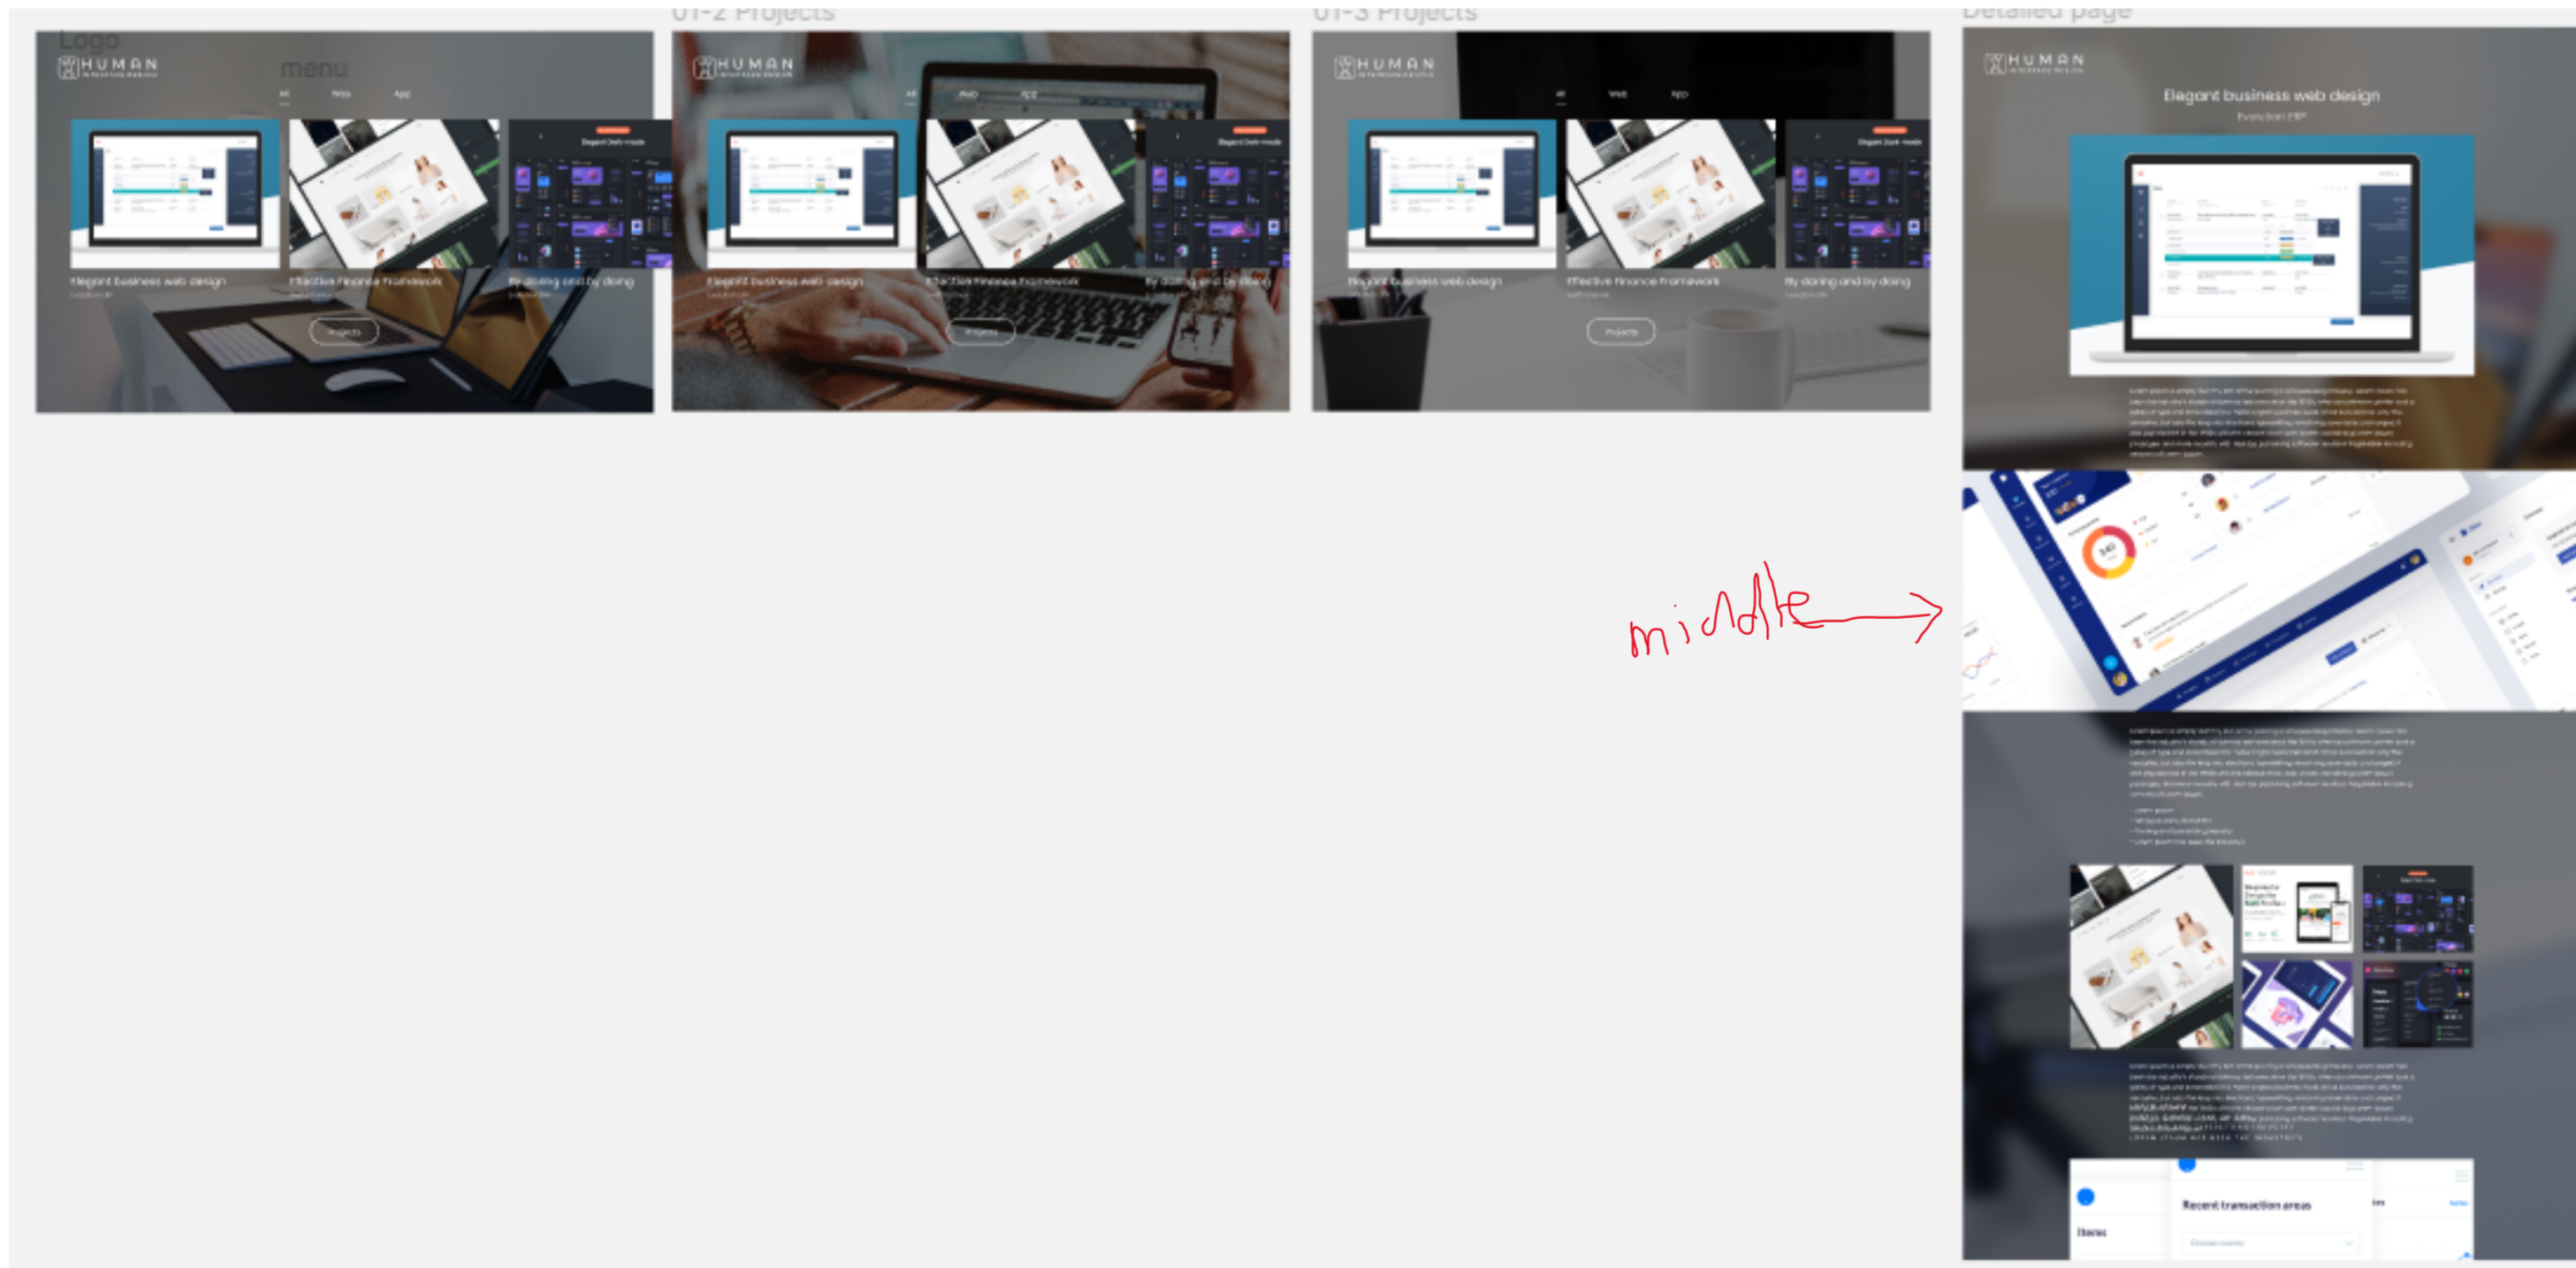

On the first page, the key will drop from the top animated with some momentum and gravity, it should bounce slightly and then rest in position. Then the line will start to animate going from the start to the right, while the text will slide up just a bit slightly from the line (invisible cutoff close to the line)
On the second page, the image will just fade in, before completing, the line will start its motion from the left of the screen to the right, then the text will slide up for the one above the line, slide down for the one below
3rd page, Image will brighten from the flare line, line goes as usual until the point, then the [ ] will animate from small at the center of the page to become larger, after it is in place, the text will fade in to brightest first before settling in about 90-80% alpha
4th page, the line will animate first, the line goes as usual, the text goes like usual. After the text completes (or during), the background image will fade in while the circle line will go 2 separate instantaneous animation, completing the circle

1st page, the dot circle will start from the center and expand out, while the image fades in blurred and then set to focus as it stops. Then the text fades in before the line start to draw.
2nd page, while the line is moving, the blocks will come in first to the page, while the text slides in (as usual) the image of the child fades into view
3/4/5/6 page, the line will come in and split to 2 directions simultaneously to create a square, then the text should fade in one at a time, random would be much better here. The image on the phone will be transitioning from one to the next in about 2000-3000ms interval
The last page, the image will fade in first, line keeps going and the text will slide in when the line is passing it, "In Essence" will come fade in when the top text settles

There is only 2 pages here:
1st page, the image will come in blurred, and the floating button will act as an unblurrer. At start the button will swipe across the person's face and mobile, before settling back at the center of the page (center lower part), the text will fade in top first, then bottom
2nd page, the text will fade in first, then the background is a collage, where the images will come in random about 4 images, before the rest fades in to show the entire collage

These are just regular portfolio display:
The slider will be momentum animated, it will slide in first and "braking" to position (easing out), the text can lag behind for effect
clicking on a project will "open" up the page to animate it to the center making the page look like it is openign. Then the preview will be done in paralax, the middle image will scroll at a different speed than the other pages, thus giving in an effect. Then the imges and font should fade in staggered, one at a time at different interval to create an effect

The image will load in blurred to unblurred, while the form will come in from the center to expand to its size
The text will come fade in staggered, from the top to bottom like waterfall (1st question)
The next questions will come slide in depending on the arrow interaction
